

Finals Task 2. Navigating Power BI

In this project, I constructed a structured relational data model in Power BI and used it to design a comprehensive flight performance dashboard that visualizes key operational metrics like delays, cancellations, and on-time trends.

In this image, I built a star schema data model by establishing one-to-many relationships connecting the central **flight_data** fact table to the **cancellation_codes**, **airlines**, and **airports** dimension tables.

In this image, I created an interactive Power BI dashboard featuring high-level cards for total,

delayed, and canceled flights, line charts tracking monthly trends, and a donut chart breaking down cancellation descriptions.
