

Finals Task 5. Forecasting Reports in PowerBi

In this final phase of the project, I incorporated advanced predictive and dynamic analytical elements into my report by developing an animated quarterly scatter plot to monitor historical multi-variable business metric trends and applying a time-series forecast to project future sales pipelines.

In this image, I configured an advanced scatter chart visual in Power BI utilizing a play axis to dynamically animate and track changes in the sum of sales, profit margin, and sum of quantity across consecutive quarters up to FY2020 Q4.

In this image, I implemented a time-series forecasting model on a daily sales line chart, leveraging Power BI's analytics pane to project a 10-month future sales trend alongside a 95% confidence interval shading block.
